

Proving identities about programs

Four aids for doing this

- (1) Function definition
- (2) Previously proved results
- (3) Principle of induction on lists

Suppose $P(l)$ is a property about lists

$$\left. \begin{array}{l} P() \text{ and} \\ P(i) \Rightarrow P(\text{cons } x \ i) \end{array} \right\} \Rightarrow \forall l P(l)$$

①

Prove

$$\forall l_1 l_2. (\text{length} (\text{append } l_1 \ l_2)) = (+ (\text{length } l_1) (\text{length } l_2))$$

Consider an arbitrary l_2

$$P(l_1) = (\text{length} (\text{append } l_1 \ l_2)) = (+ (\text{length } l_1) (\text{length } l_2))$$

We want to prove $\forall l_1 P(l_1)$

Base case $P()$

$$\begin{aligned} \text{LHS} &= (\text{length} (\text{append } () \ l_2)) \\ &= (\text{length } l_2) \end{aligned}$$

$$\begin{aligned} \text{RHS} &= (+ (\text{length } ()) (\text{length } l_2)) \\ &= (+ 0 (\text{length } l_2)) \\ &= \text{length } l_2 \end{aligned}$$

$$\text{Ind. hyp: } (\text{length} (\text{append } l \ l_2)) = (+ (\text{length } l) (\text{length } l_2))$$

$$\begin{array}{l} \text{Ind. step} \\ \text{To show} \end{array} \left\{ \begin{array}{l} (\text{length} (\text{append } (\text{cons } x \ l) \ l_2)) = \\ (+ (\text{length } (\text{cons } x \ l)) (\text{length } l_2)) \end{array} \right.$$

$$\begin{aligned} \text{LHS} &= (\text{length} (\text{cons } x \ (\text{append } l \ l_2))) \\ &= (+ 1 (\text{length} (\text{append } l \ l_2))) \\ &= (+ 1 (+ (\text{length } l) (\text{length } l_2))) \\ &= (+ (+ 1 (\text{length } l)) (\text{length } l_2)) \\ &= (+ (\text{length } (\text{cons } x \ l)) (\text{length } l_2)) \\ &= \text{RHS} \end{aligned}$$

$$\forall l_1 \forall l_2: (\text{length} (\text{append } l_1 \ l_2)) = (+ (\text{length } l_1) (\text{length } l_2))$$

② Prove $\forall l \ (\text{append } l \ ()) = l$

Base case: Show $(\text{append } () \ ()) = ()$

Ind. hyp: Assume $(\text{append } l_1 \ ()) = l_1$

Show $(\text{append } (\text{cons } x \ l_1) \ ()) = (\text{cons } x \ l_1)$

$$\begin{aligned} \text{LHS} &= (\text{append } (\text{cons } x \ l_1) \ ()) && \{ \text{Defn: append} \} \\ &= (\text{cons } x \ (\text{append } l_1 \ ())) && \{ \text{Ind. hyp} \} \\ &= (\text{cons } x \ l_1) \\ &= \text{RHS} \end{aligned}$$

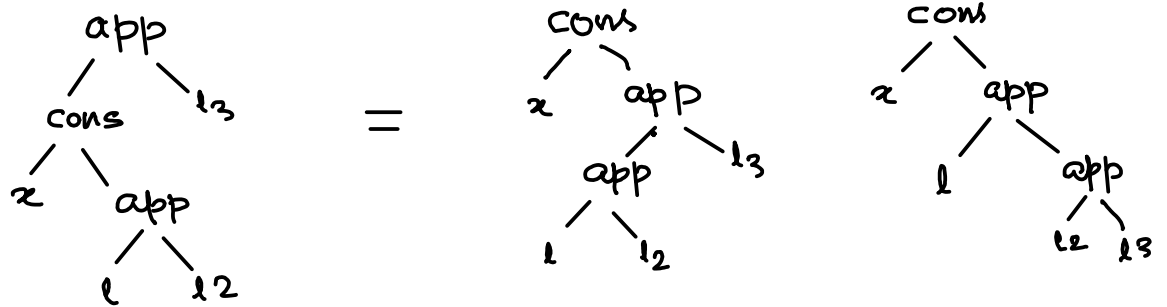

③ Prove $(\text{append} (\text{append } l_1 \ l_2) \ l_3) = (\text{append } l_1 \ (\text{append } l_2 \ l_3))$

(i) Base case - $(\text{append} (\text{append } () \ l_2) \ l_3) = (\text{append } () \ (\text{append } l_2 \ l_3))$

(ii) Assume $(\text{append} (\text{append } l \ l_2) \ l_3) = (\text{append } l \ (\text{append } l_2 \ l_3))$

Show $(\text{append} (\text{append} (\text{cons } x \ l) \ l_2) \ l_3) = (\text{append} (\text{cons } x \ l) \ (\text{append } l_2 \ l_3))$

4

Show $\forall l \text{ (rev (rev } l)) = l$

Induction on l .

Base $(\text{rev (rev } ())) = ()$

LHS = $(\text{rev } ())$

= $()$

Assume

$(\text{rev (rev } l1)) = l1$

Show

$(\text{rev (rev (cons } x \text{ } l1))) = (\text{cons } x \text{ } l1)$

Bringing the two revs together will allow us to apply the induction hypothesis:

Conjecture

5

Show $\text{rev}(\text{app } l1 \ l2) = (\text{app } (\text{rev } l2) (\text{rev } l1))$

Induction on $l1$

Base: $\text{rev}(\text{app } () \ l2)$

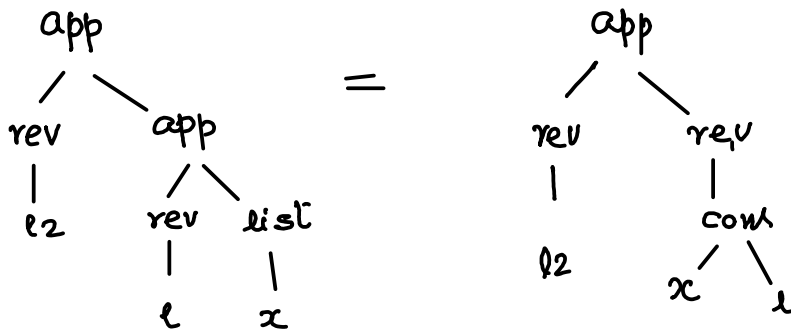

LHS = $\text{rev}(\text{app } l2)$

RHS = $(\text{app } (\text{rev } l2) (\text{rev } l1))$

= $(\text{app } (\text{rev } l2) ())$

= $(\text{rev } l2)$ (Previous result)

Assume - $(\text{rev}(\text{app } l \ l2)) = (\text{app } (\text{rev } l2) (\text{rev } l))$

⑥ Prove $\text{map } f (\text{append } x \ y) = (\text{append } (\text{map } f \ x) (\text{map } f \ y))$

Induct on x

Base case $\cdot \text{map } f (\text{append } () \ y)$
 $= \text{map } f \ y =$
 $= (\text{append } () (\text{map } f \ y))$
 $= (\text{append } (\text{map } f \ ()) (\text{map } f \ y))$

Assume $(\text{map } f (\text{append } x \ y))$
 $= (\text{append } (\text{map } f \ x) (\text{map } f \ y))$

To prove $(\text{map } f (\text{append } (\text{cons } a \ x) \ y))$
 $= (\text{append } (\text{map } f (\text{cons } a \ x)) (\text{map } f \ y))$

7

$$(\text{foldr } (+) (\text{sum } x) y) = (+ (\text{sum } x) (\text{sum } y))$$

Base case: easy

$$\text{Assume } (\text{foldr } + (\text{sum } x) y) = (+ (\text{sum } x) (\text{sum } y))$$

8

$$(\text{define } (\text{compose } f g) (\text{lambda } (x) (f (g x))))$$

Show that

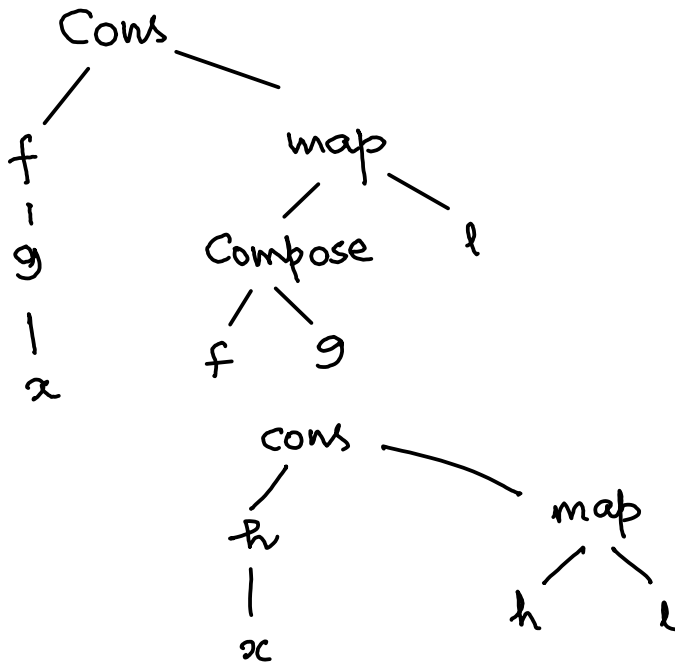

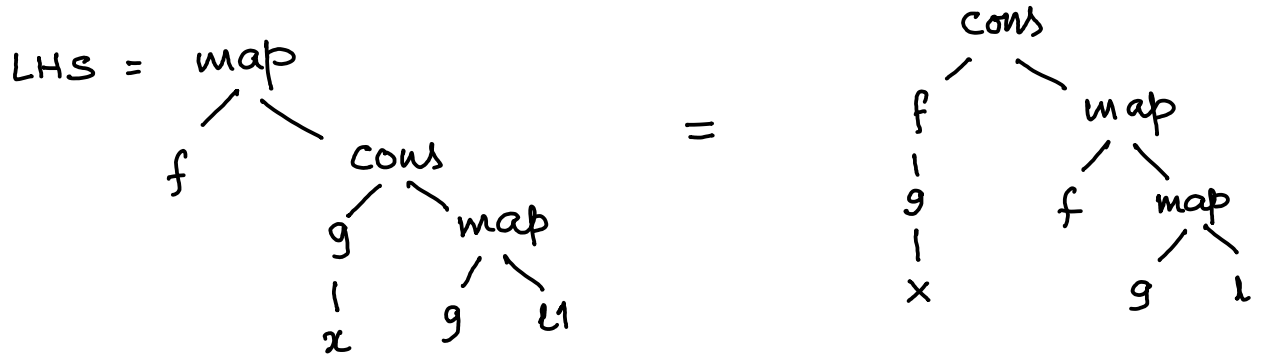

Base case — Easy

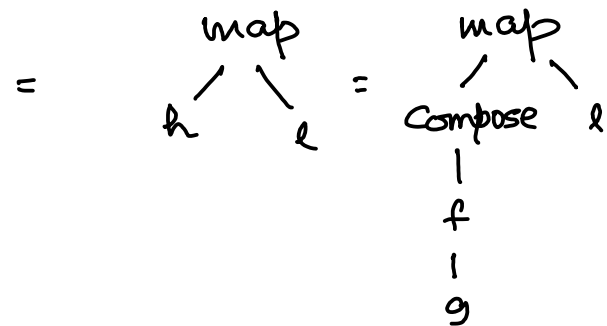

Assume

Show

let h be (compose f g)

⑨ (define (mf l) (map f l))
 (define (append* l)
 (if (null? l) '()
 (append (car l)
 (append* (cdr l)))))

Show that

$$(\text{map } f (\text{append* } l)) =$$

$$(\text{append* } (\text{map } mf \ l))$$

Base case: Easy

Assume:

Prove:
